

Research Questions

Question 1: Can a student's total assessment score, the GDP per capita of their home country, and the average growth rate of their chosen industry accurately predict their starting salary?

Question 2: Do students from high-income nations have a significantly higher placement rate in the Tech and Consulting industries compared to students from low-income nations?

Data Sources and Summaries

Name: Global Student Placement Data

URL: <https://www.kaggle.com/datasets/global-placement>

Summary: This dataset contains 10,000 records of global university students, detailing their academic performance (CGPA, assessment scores), specialization, and their final job placement status and starting salary.

Dimension Table 1 (Student 1):

Name: Country GDP and Demographics

URL: <https://www.kaggle.com/datasets/ppb00x/country-gdp>

Summary: This dataset provides macroeconomic indicators, specifically the total population and GDP per capita, for sovereign nations worldwide, allowing us to categorize students by the economic standing of their home country.

Dimension Table 2 (Student 2):

Name: Global Industry Growth Metrics

URL: <https://www.kaggle.com/datasets/sazidthe1/world-gdp-growth>

Summary: This dataset outlines the average annual growth rate and baseline economic value of major global industries (such as Tech, Healthcare, and Consulting), providing context on the market demand for the students' chosen career paths.

Table Joins Description

Join 1: I'll use a many-to-one relationship between the country field in the primary Global Placement table and the Country field in the Country GDP dimension table.

Join 2: I'll use a many-to-one relationship between the industry field in the primary Global Placement table and the Industry field in the Industry Growth dimension table.
